Pre-Surgical Planning

Cost Efficiency

Faster Operations

Patient Specific

MODEL OPTIONS

1 In a new innovative feature, 3D Life presents the unique opportunity to parents to-be, to hold a 3D Model of their baby's face or the embryo to be born, during pregnancy, before the baby is born! The exact face of the baby to be born, is a unique way to see and touch your baby before it is even born!

2 3D Life has printed the first 3D model of a two-chamber uterus that has been used for pre surgical planning and evaluation! It is common, especially in laparoscopic procedures that gynecologists have no sense of touch. As a result, they cannot know the internal and external lining of the uterus resulting to difficult and longer operations.

CUSTOMIZATION

UTERUS MODEL: According to Patient/Surgeon Needs, the Uterus model can present different medical conditions/tumors.

BABY MODEL: The embryo can be printed in Blue-Pink, with emphasis on the blue if the baby to be is a boy, or with emphasis on the pink, if the baby to be is a girl, or according to patient specifications

ORDER NOW

And have your model delivered at the place of your selection and plan your operation before the patient enters the surgery room!
